GOV.UK DESIGN PRINCIPLES

Government Design Principles

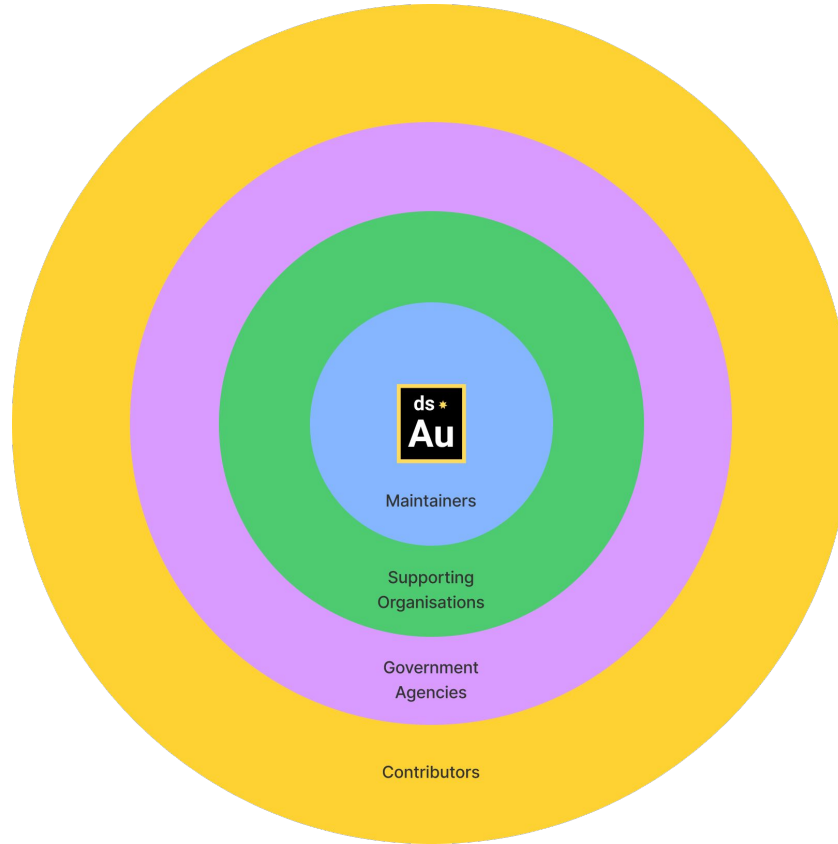

- 1 Start with user needs
- 2 Do less
- 3 Design with data
- 4 Do the hard work to make it simple
- 5 Iterate. Then iterate again
- 6 This is for everyone
- 7 Understand context
- 8 Build digital services, not websites
- 9 Be consistent, not uniform
- 10 Make things open. It makes things better

## Intl.NumberFormat v3 for stage 3
Presenter: Shane Carr (SFC)

- [proposal](https://github.com/tc39/proposal-intl-numberformat-v3#readme)
- [slides](https://docs.google.com/presentation/d/1ubtY4v7ETfutQIxtayxPVVS1hQx8zg7yF0l0tEYomc/edit)

SFC: Hello everyone. I'm here to present my proposal: Intl.NumberFormat v3 for Stage 3. So first, let me go ahead and just for people who haven't seen this proposal yet just tell you what this is all about. This first came up for Stage 1 last year. So this has been baking for about almost a year and a half. Now for this proposal, the way that we came up with this was by going through all of the feature requests that get filed against the ecma-402 repository and evaluating each one of them based on its merits based and in particular, based on whether it has a lot of stakeholders, whether it has prior art, and whether it's expensive to implement in user land. Just as an example, these are two features that we considered: additional scientific notation styles, but we decided not to implement that particular feature because it doesn't have a lot of stakeholders, and it doesn't have a lot of prior art. Whereas Number Ranges had a lot of stakeholders and a lot of prior art, so that's how we came up with this proposal.

SFC: So, I'll go ahead now and show you what got into the proposal, what we're hoping to advance, and I will highlight updates. The last time I gave a presentation on this was at the April meeting, and I'll highlight any changes that have been made since April.

SFC: Okay, so first we have the format range function in Intl number format. This supports all of the features that are otherwise supported in Intl.NumberFormat. It allows ranges of currencies, numbers, and measurement units. As you can see here, here are some details about how it works. The formatToParts will follow a model much like datetimestructure range. We use a localized approximately symbol. We also support this in Intl plural rules and we support ranges to Infinity but not NaN.

SFC: The next is the grouping enum. So, for the grouping enum, this has been one of the biggest pain points, one of the top two issues that gets filed against 402 is that people want more control over how to display grouping
```

Iterate.
Iterate.
Iterate.
Iterate.
Iterate.
Iterate.
Iterate.
Then
iterate
again
